Docker with overlay support

Just got the new beta version of Docker, with depreciation warning of AUFS. It's so bad news when InterSystems does not support used by default storage driver overlay2. Recently I thought to play with Google Kubernetes Engine, and realized that I can't work with InterSystems products there due to incompatibility with Storage Driver. Maybe it's already time to think about support?

AUFS storage driver is deprecated in Docker Desktop

You are currently using the AUFS storage driver. AUFS support will be removed in the next major release of Docker Desktop.

You can continue with AUFS in Docker Desktop 18.06.x, but you will need to reset disk image (in Preferences > Reset menu) before updating to the next major update.

You can check documentation to [save images](#) and [backup volumes](#)

OK
