Integrating InterSystems IRIS with Source Control Systems (GitHub/Azure)

I am currently evaluating Source Control systems that we can use for both MS SQL, MS Visual Studio, and InterSystems IRIS. For both MS SQL and MS Visual Studio we do have the option of either Azure or GitHub. I understand when we upgrade to IRIS 2019.1 we have options for Source Control, and in previous Global Summit's I have heard GitHub discussed. So why can't I user GitHub for both MS SQL/MS Visual Studio and IRIS?

A couple of questions come to mind starting to think about Source Control

1. When integrating Source Control in an IRIS environment, is that source control just used for Code done in Studio, or can it be used for DTL, Business Process, Schema Editor, and etc?
2. Has anyone integrated IRIS with GitHub? Can you please provide examples.
3. How secure is the Source Control if you integrate it with GitHub?

Just trying to figure out the better route and if we can kill two birds with one stone.

Thanks

Scott Roth
