## ¿Cómo especificar el nombre de la columna (ddl)?

¡Hola!

¿Cómo puedo especificar el nombre de una columna (ddl)?

```
IRIS/SAMPLES@SuperUser - Default_SuperUser.prj - Studio - [triggers.AccountTriggers.cls +]
File Edit View Project Class Build Debug Tools Utilities Window Help

triggers.AccountTriggers.cls +
Class triggers.AccountTriggers Extends %Persistent [ SqlTableName = sys_account ]
{
  // first_name
  Property fristName As %String [ Required ];
  // last_name
  Property LastName As %String [ Required ];
  // ----
  Storage Default
  {
    <Data name="AccountTriggersDefaultData">
      <Value name="1">
        <Value>%%CLASSNAME</Value>
      </Value>
      <Value name="2">
        <Value>fristName</Value>
      </Value>
    </Data>
  }
}
```

The screenshot shows the Database Navigator on the left with the 'sys\_account' table selected. The main window displays the table's structure:

Column Name	#	Data Type	Length	Scale	Not Null	Auto Generated	Auto Increment	Default	Description
ID	1	BIGINT	19		[X]	[X]	[X]	\$(^triggers.Account...)	ID
LastName	2	VARCHAR	50		[X]	[ ]	[ ]		LastName
fristName	3	VARCHAR	50		[X]	[ ]	[ ]		fristName

Red arrows in the original image point from 'last\_name' in the code to the 'LastName' column and from 'frist\_name' in the code to the 'fristName' column.
